# Dates and times with lubridate :: **CHEAT SHEET**

#### **Date-times** 2017-11-28 12:00:00 2017-11-28 A **date-time** is a point on the timeline, A **date** is a day stored as stored as the number of seconds since 1970-01-01 00:00:00 UTC 1970-01-01 dt <- as\_datetime(1511870400) d <- **as\_date(**17498**)** 2017-11-28 12:00:00 ## "2017-11-28 12:00:00 UTC" ## "2017-11-28" **PARSE DATE-TIMES** (Convert strings or numbers to date-times) 1. Identify the order of the year (**y**), month (**m**), day (**d**), hour (**h**), minute (**m**) and second (**s**) elements in your data. 2. Use the function below whose name replicates the order. Each component in place. accepts a tz argument to set the time zone, e.g. ymd(x, tz = "UTC"). ymd\_hms(), ymd\_hm(), ymd\_h(). 2017-11-28714:02:00 vmd hms("2017-11-28T14:02:00") ydm\_hms(), ydm\_hm(), ydm\_h(). 2017-22-12 10:00:00 ydm hms("2017-22-12 10:00:00" mdy\_hms(), mdy\_hm(), mdy\_h(). 11/28/2017 1:02:03 mdy hms("11/28/2017 1:02:03") dmy\_hms(), dmy\_hm(), dmy\_h(). 1 Jan 2017 23:59:59 dmy hms("1 Jan 2017 23:59:59" ymd(), ydm(). ymd(20170131) 20170131 mdy(), myd(). mdy("July 4th, 2000") July 4th, 2000 dmy(), dym(). dmy("4th of July '99") 4th of July '99 yq() Q for quarter. yq("2001: Q3") 2001: 03 2018-01-31 11:59:59 UTC my(), ym(). my("07-2020") 07-2020 2:01 hms::hms() Also lubridate::hms(), **hm()** and **ms()**, which return **periods.\*** hms::hms(sec = 0, min= 1, hours = 2, roll = FALSE) ..... JASOND date\_decimal(decimal, tz = "UTC") 2017.5 date decimal(2017.5) JASOND **now(**tzone = "") Current time in tz (defaults to system tz). now() today(tzone = "") Current date in a tz (defaults to system tz). today() fast\_strptime() Faster strptime. fast\_strptime('9/1/01', '%y/%m/%d') parse\_date\_time() Easier strptime.

Studio

An hms is a **time** stored as the number of days since the number of seconds since 00:00:00 t <- hms::as\_hms(85) ## 00:01:25 **GET AND SET COMPONENTS** d ## "2017-11-28" Use an accessor function to get a component. dav(d) ## 28 Assign into an accessor function to change a day(d) <- 1 d ## "2017-11-01" 2018-01-31 11:59:59 date(x) Date component. date(dt) year(x) Year. year(dt) 2018-01-31 11:59:59 isoyear(x) The ISO 8601 year. epivear(x) Epidemiological vear. 2018-01-31 11:59:59 month(x, label, abbr) Month. month(dt) day(x) Day of month. day(dt) 2018-01-31 11:59:59 wday(x, label, abbr) Day of week. qday(x) Day of quarter. 2018-01-31 11:59:59 **hour(x)** Hour. hour(dt) 2018-01-31 11:59:59 **minute(x)** Minutes. minute(dt) 2018-01-31 11:59:59 second(x) Seconds. second(dt) tz(x) Time zone. tz(dt) week(x) Week of the year. week(dt) × isoweek() ISO 8601 week. JASOND epiweek() Epidemiological week. quarter(x) Quarter. quarter(dt)

12:00:00

semester(x, with\_year = FALSE)
Semester. semester(dt)

am(x) Is it in the am? am(dt)
pm(x) Is it in the pm? pm(dt)

dst(x) Is it daylight savings? dst(d)

leap\_year(x) Is it a leap year?
leap\_year(d)

update(object, ..., simple = FALSE)
update(dt, mday = 2, hour = 1)

## **Round Date-times**

floor\_date(x, unit = "second")
Round down to nearest unit.
floor\_date(dt, unit = "month")

lubridate

round\_date(x, unit = "second")
Round to nearest unit.
round date(dt, unit = "month")

ceiling\_date(x, unit = "second", change\_on\_boundary = NULL) Round up to nearest unit. ceiling\_date(dt, unit = "month")

Valid units are second, minute, hour, day, week, month, bimonth, quarter, season, halfyear and year.

rollback(dates, roll\_to\_first = FALSE, preserve\_hms = TRUE) Roll back to
last day of previous month. Also rollforward(). rollback(dt)

# Stamp Date-times

stamp() Derive a template from an example string and return a new function that will apply the template to date-times. Also stamp\_date() and stamp\_time().

> **1.** Derive a template, create a function sf <- stamp("Created Sunday, Jan 17, 1999 3:34")

2. Apply the template to dates
 sf(ymd("2010-04-05"))
 ## [1] "Created Monday, Apr 05, 2010 00:00"

# Time Zones

R recognizes ~600 time zones. Each encodes the time zone, Daylight Savings Time, and historical calendar variations for an area. R assigns *one* time zone per vector.

Use the UTC time zone to avoid Daylight Savings.

OlsonNames() Returns a list of valid time zone names. OlsonNames()

Sys.timezone() Gets current time zone.

5:00 6:00 Central 7:00 Mountain 4:00 Eastern Pacific MT ET СТ 7:00 7:00 Eastern Pacific 7:00 7:00 Central Mountain

with\_tz(time, tzone = "") Get
the same date-time in a new
time zone (a new clock time).
Also local\_time(dt, tz, units).
with\_tz(dt, "US/Pacific")

force\_tz(time, tzone = "") Get
the same clock time in a new
time zone (a new date-time).
Also force\_tzs().
force\_tz(dt, "US/Pacific")

parse\_date\_time("9/1/01", "ymd")

# Math with Date-times – Lubridate provides three classes of timespans to facilitate math with dates and date-times.

#### A normal day

The end of daylight savings (fall back) lap <- ymd hms("2018-11-04 00:30:00",tz="US/Eastern")

Leap years and leap seconds leap <- ymd("2019-03-01") 2019 2020

2020

**Periods** track changes in clock times,

which ignore time line irregularities.

### **Durations** track the passage of physical time, which deviates from clock time when irregularities occur.

**Intervals** represent specific intervals of the timeline, bounded by start and end date-times.

interval(lap, lap + minutes(90))

Not all years are 365 days due to leap days.

Not all minutes are 60 seconds due to leap seconds.

It is possible to create an imaginary date by adding **months**, e.g. February 31st

lubridate

jan31 <- ymd(20180131) jan31 + months(1) ## NA

%m+% and %m-% will roll imaginary dates to the last day of the previous month.

#### jan31 %m+% months(1) ## "2018-02-28"

add\_with\_rollback(e1, e2, roll to first = TRUE) will roll imaginary dates to the first day of the new month.

add with rollback(jan31, months(1), roll to first = TRUE) ## "2018-03-01"

### PERIODS

Number

of month

Add or subtract periods to model events that happen at specific clock times, like the NYSE opening bell.

2021

Make a period with the name of a time unit *pluralized*, e.g.

Number

of day:

Studio

years(x = 1) x years. months(x) x months. weeks(x = 1) x weeks. days(x = 1) x days. **hours(**x = 1) x hours. **minutes(**x = 1) x minutes. **seconds**(x = 1) x seconds. **milliseconds**(x = 1) x milliseconds. **microseconds**(x = 1) x microseconds **nanoseconds**(x = 1) x nanoseconds. **picoseconds**(x = 1) x picoseconds.

period(num = NULL, units = "second", ...) An automation friendly period constructor. period(5, unit = "years")

as.period(x, unit) Coerce a timespan to a period, optionally in the specified units. Also is.period(). as.period(i)

period\_to\_seconds(x) Convert a period to the "standard" number of seconds implied by the period. Also **seconds\_to\_period()**. period to seconds(p)

### **DURATIONS**

econds

Add or subtract durations to model physical processes, like battery life. Durations are stored as seconds, the only time unit with a consistent length. **Difftimes** are a class of durations found in base R.

.....

Make a duration with the name of a period prefixed with a **d**, e.g.

make\_difftime(x) Make difftime with the specified number of units. make\_difftime(99999)

### **INTERVALS**

Divide an interval by a duration to determine its physical length, divide an interval by a period to determine its implied length in clock time.

.....

Make an interval with interval() or %--%, e.g.

i <- interval(vmd("2017-01-01"), d) i <- d %--% ymd("2017-12-31")

## 2017-01-01 UTC--2017-11-28 UTC ## 2017-11-28 UTC--2017-12-31 UTC

Start

End

a **%within%** b Does interval or date-time *a* fall within interval b? now() %within% i

an interval. Also int\_end(). int start(i) <- now();

int\_aligns(int1, int2) Do two intervals share a **boundary?** Also int\_overlaps(). int\_aligns(i, j)

int\_diff(times) Make the intervals that occur

between the date-times in a vector.

v <-c(dt, dt + 100, dt + 1000); int diff(v)

**int\_flip(**int**)** Reverse the direction of an

interval. Also int\_standardize(). int\_flip(i)

int\_length(int) Length in seconds. int length(i)

**int shift**(int, by) Shifts an interval up or down **the timeline by a timespan.** int shift(i, days(-1))

**as.interval**(x, start, ...) Coerce a timespan to an interval with the start date-time. Also is.interval(). as.interval(days(1), start = now())

**dmonths(**x = 1) 2629800x seconds. dweeks(x = 1) 604800x seconds. **dmilliseconds**(x = 1)  $x \times 10^{-3}$  seconds. **dmicroseconds**(x = 1)  $x \times 10^{-6}$  seconds.

**dpicoseconds**(x = 1)  $x \times 10^{-12}$  seconds.

duration(num = NULL, units = "second", ...) An automation friendly duration **constructor.** duration(5, unit = "years")

2021

**as.duration**(x, ...) Coerce a timespan to a duration. Also is.duration(), is.difftime(). as.duration(i)
